

Arnaud Schwartz, national secretary, France Nature Environnement (FNE)
member of the European Economic and Social Committee (EESC)

New GMOs are nothing more than GMOs made with new genetic modification techniques.

Their advocates, including the agribusiness giants, are trying to make it seem that this is only genetic selection and that everything is "precise and clean" when in reality these techniques do indeed require human intervention on the organization of the DNA chain, whose effects are poorly controlled. As such, why put them in a separate category? If this were the case, the new GMOs would escape any assessment of the environmental, health, economic and social impacts, and the products that would contain them would not be labeled.
